## **Project Description**

PCDM application is targeted towards healthcare professionals working in various fields such as nursing, diagnosis, surgery and primary healthcare.

This application is meant to comply and follow the REST API implementation in terms of usability structure to make the app more feasible to improvements and scalability.

It follows the structure of a private access code given from the health organization to healthcare professional for quick logins and to aid in data security and privacy. As a result, this application aims at following all the regulations and complies with the HIPAA act.

The PCDM app allows healthcare providers to view detailed clinical data for each patient and also allows professionals to figure out if any patient is in critical condition.

It allows the healthcare provider to add/view the Patient Medical History, can keep an eye on the current health status of different patients registered in the system. The app also holds contact informations of patients, doctors and different clinical data such as Blood Pressure, Respiratory Rate, Blood Oxygen Level etc.

Splash Screen

Description:  
Splash screen should contain the logo branding, background, etc. This screen would remain for the minimum duration of the app loading time.

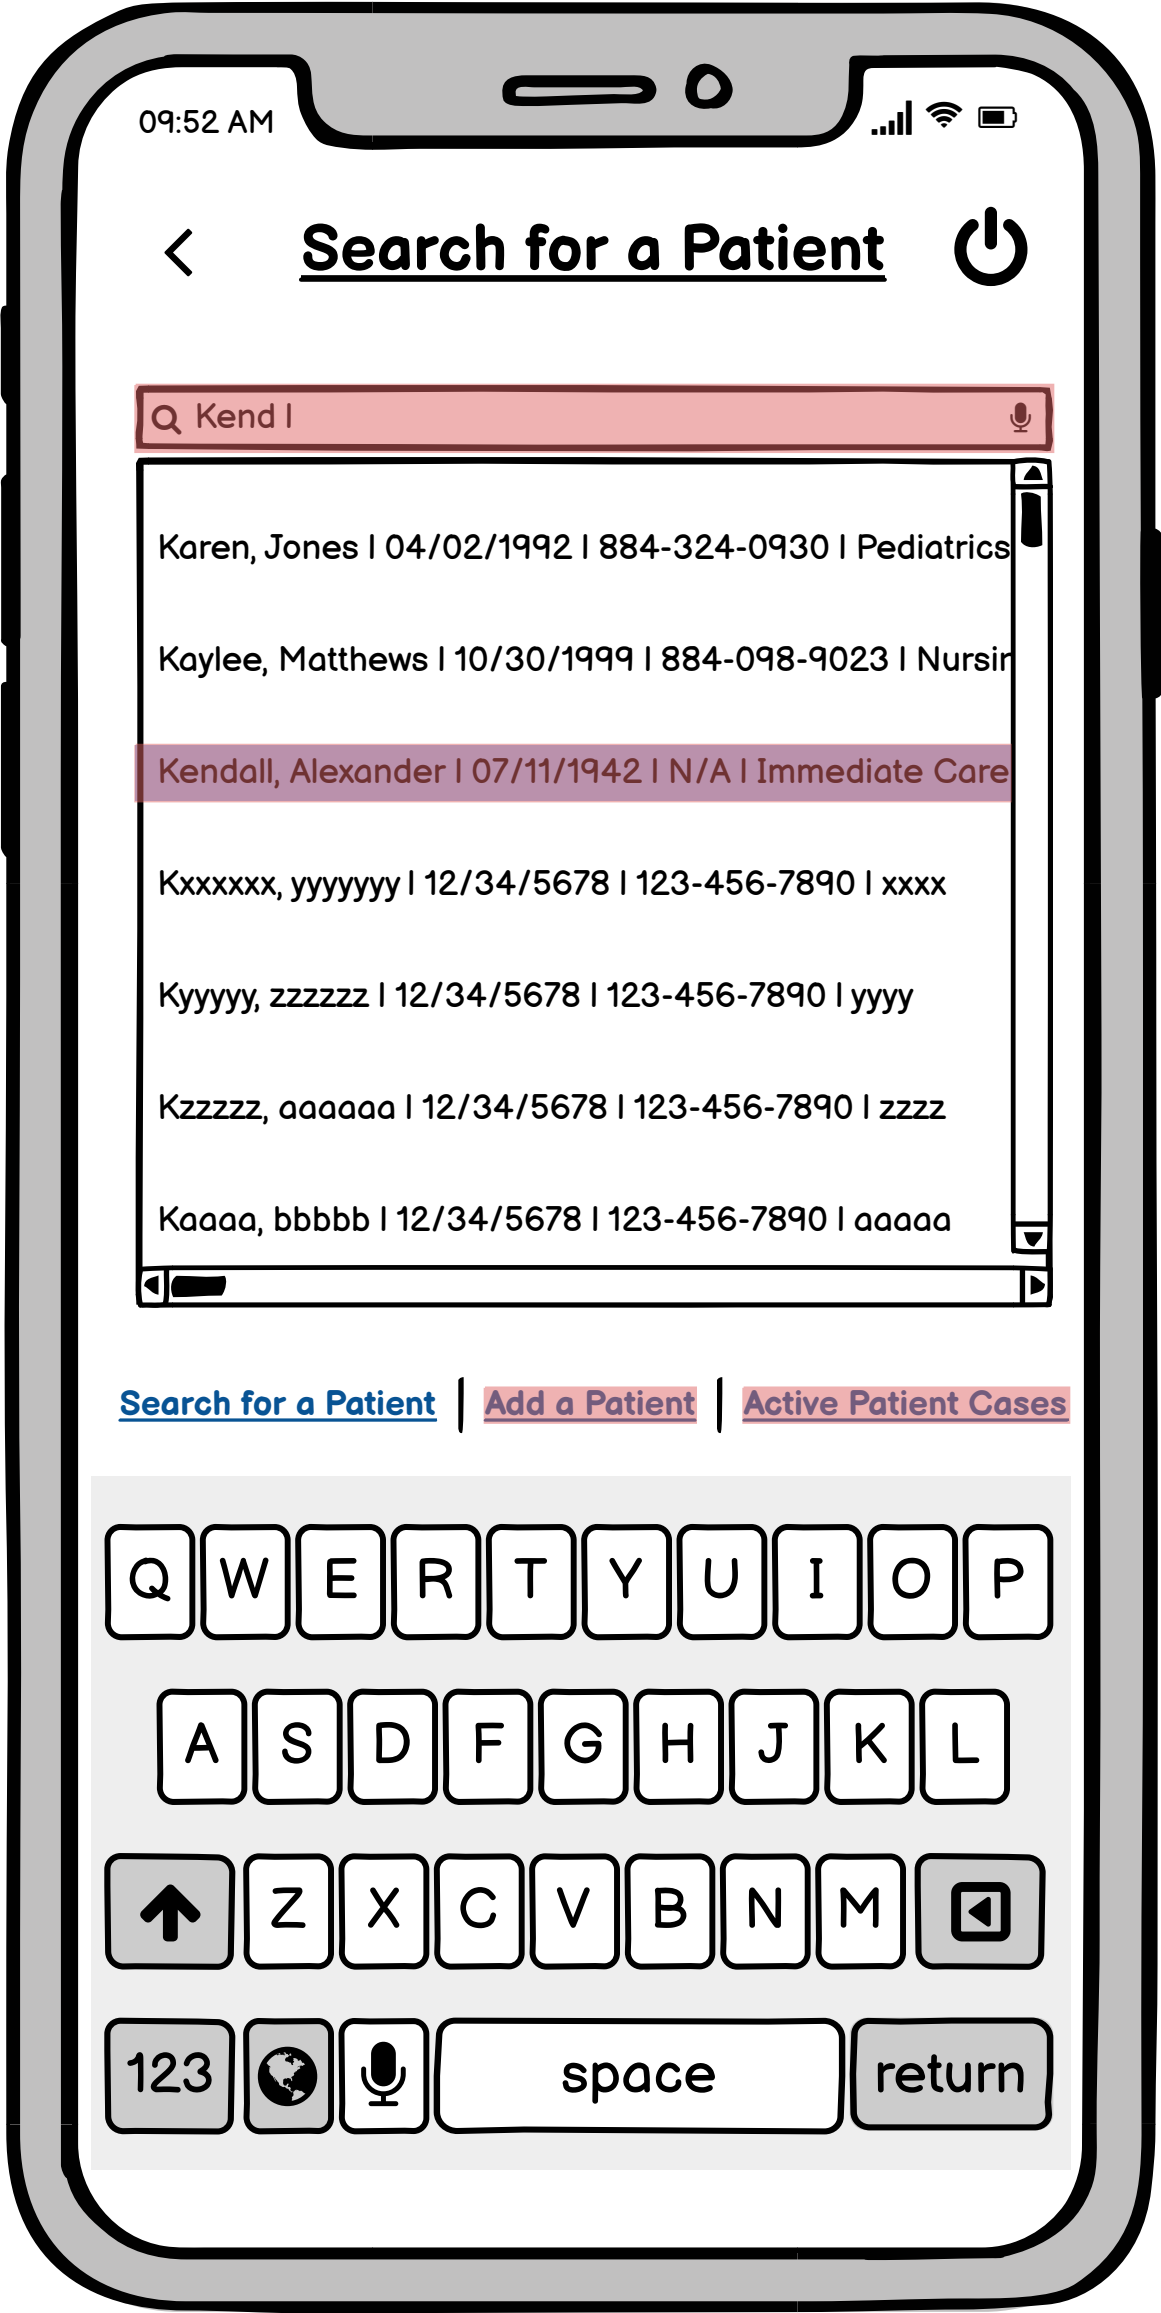

Description:

This screen requests the user to verify proper access code to grant login permissions.

Quick-access login methods such as this authenticator helps healthcare professionals quickly gain access to the system and patient data in terms of emergencies through their private access code granted by their organization.

In the event of loosing/forgetting/changing the access code, the healthcare professional can reach out to the organization’s IT services departure by pressing the ‘Help’ button.

Description:  
Healthcare professionals can choose to either ‘Search for a Patient’, ‘Add a Patient’ OR ‘ view ‘Active Patient Cases’ corresponding to their task requirements using the bottom-navigation.

‘Search for a Patient’ helps the healthcare professional to enter their patient’s name and choose their patient from the drop-down list.

‘Add a Patient’ option enrolls a new patient into the system database followed by adding their medical history.

‘Active Patient Cases” helps identify current on-going cases based on the severity that are either being viewed by other doctors or updated by nurses. The levels of severity usually range from ‘Critical’, ‘Diagnosis’, ‘Stable’ & ‘Recovery’.

Additional navigation options such as ‘Back’ button to go to the previous screen as well as ‘Logout’ button to exit from the app.

Active Patient Cases

Description:  
This screen provides ‘Medical History’ of the patient to the healthcare professional.

More detailed personal health information on the patient is stored in this screen.

A new patient is then successfully added to the healthcare system’s database after completing this process.

Description:  
This screen holds on-going patient cases ranging from various severity stages.

The doctor can also sort through the list to filter out their specific categories of patient condition and choose to consult them.

When selecting a particular patient, they are redirected to the 'View Patient Record' screen where the doctors can get latest and updated information on the patient's file.
